Tividale Comprehensive School, West Midlands

Coating System Used: SCL 90 Durathane

Before

Before

Before

The existing roof was asphalt and felt membrane which was at an advanced stage of weathering and some degradation had occurred causing problem leaks. The project also involved waterproofing two flat felt roofs.

Seamless Coatings were approached by Sandwell Council with the task of putting forward a 10 year cold-applied liquid coating system. SCL 90 Durathane works by encapsulating the roof in a seamless barrier membrane, that is not only 100% waterproof but also allows the roof to breathe. This safe, durable and cost effective system effectively extends the life of a failing roof and was therefore the perfect solution to this problem.

Prior to application the roof was cleaned and all moss removed. The existing membrane was primed with SCL PU Primer. The SCL 90 Durathane system is applied by brush and roller. This material offers unparalleled detailing capabilities around awkward areas such as pipes, protrusions, rooflights and upstands enabling the roof to be fully covered.

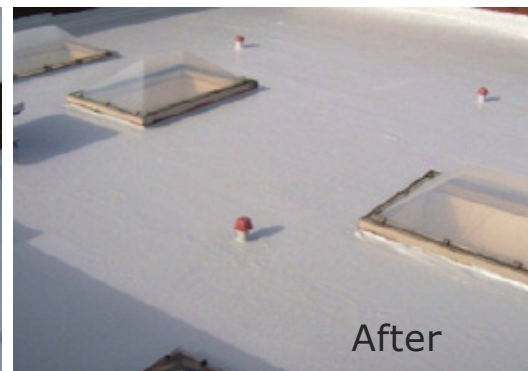

SCL 90 Durathane systems range from 10-20 years.
